ESSAY MEME: The climate change that is occurring in the present age will result in the mass extinction of many species.		
Source	YES causing ME	NO not causing ME
A-	Climate change and mass extinction link Planet hotter, altering habitats, reducing food sources, drought and severe weather	Planet has gone through heating /cooling cycles throughout history
B	Climate change demands species to be genetically varied/adapted therefore need for great biodiversity-too many species going extinct. Biodiversity reduced.	Many different causes of ME. Asteroids, better adapted, disease, human predation, lack of genetic diversity, lack of food, invasive species, loss of habitat, pollution
C- good source	Polar bears now endangered-lack of ice, food, not able to adapt quick enough, previous adaptations no longer suitable, disease, any further inc in temp polar bears will be extinct.	Some greenhouse gases are needed to prevent World freezing. Some species have been able to adapt-plants.
D good – all content rigorously researched and written by experts		Advantages of GW Previously uninhabited places now inhabitable, fewer deaths from freezing condition, longer growing seasons-more food for all. N.B. must not use points not applicable to ME.
E WWW-potentially good-for information ok, campaigning bias	Egs: of animals most affected by climate change.	
F-recent, published in reliable newspaper.	Climate change effect on endemic species-92%, classified as a mass extinction.(75%)	Only projected if temp increases by 3°C. Large areas of no effect. No indication of plant species-producers on who all other life rely.
G-Quora	**Will climate change affect ME?**	**Will climate change affect ME?** Survival will be dependent on organisms acclimatising, migrating, dispersal, ecological niche adaptation-more general adapted organisms will survive rather than die.

H-Gov publication-good	**Highway to extinction**-relocate or die-some organisms not able to adapt or relocate-endemic can only tolerate specific environments.	
OWN K.	We are in the 6th ME-result of the burning of fossil fuels-climate change and increase temps. Previous extinctions caused by natural phenomena-not one species-MAN-due to our activities (many examples-deforestation/car emissions)/all boil-down to burning of fossil fuels-big impact on emission of green house gasses Species do not survive in isolation-interconnected-food webs/chains. Many therefore affected.	ME previously took millions of years-not in such a short time period humans' have been around. Natural extinction rates occur-gives space for new species to arise and flourish. World cyclically becomes hotter and colder over long periods of time. Earth moves in and out of ice ages in regular intervals-long before HUMANS' came into existence.

Argument for: Climate change causing Mass Extinctions

Argument against: climate change not causing Mass Extinctions
